B4.1-R4: COMPUTER BASED NUMERICAL AND STATISTICAL TECHNIQUES

NOTE :

- 1. Answer question 1 and any FOUR questions from 2 to 7.
- 2. Parts of the same question should be answered together and in the same sequence.
- 3. Only Non-Programmable and Non-Storage type Scientific Calculator allowed.

| Time : 3 Hours | Total Marks : 100 |
|----------------|-------------------|
| | |

- **1.** (a) Calculate Var(X) if *x* represents the outcome when a fair die is rolled.
 - (b) The diameter of a component produced on a semi-automatic machine is known to be distributed normally with a mean of 10 mm and a standard deviation of 0.1 mm. If we pick up a random sample of size 5, what is the probability that the same mean will be between 9.95 mm and 10.05 mm ?
 - (c) Show that the geometric mean of the coefficient of regression is the coefficient of correlation.
 - (d) A cubical die was thrown 9,000 times and 1 or 6 was obtained 3120 times. Can the deviation from expected value lie due to fluctuations of sampling ?
 - (e) Find the polynomial f(x), which satisfy the following data and hence find the value of f(1.5).

| x | 1 | 2 | 3 | 4 | 5 |
|------|---|----|----|----|-----|
| f(x) | 4 | 13 | 34 | 73 | 136 |

(f) N is function of the different measurable quantities u, v, w, x, y and is given by

$$N = \frac{u^p v^q w^r}{x^s y^t}$$

find an upper limit to the relative error in the measure of N.

(g) The arithmetic mean of the runs scored by three batsmen Rohit, Mohit and Lohit in the series are 50, 48 and 12 respectively. The standard deviations of their runs are 15, 12 and 2 respectively. Who is the most consistent of the three ? (7x4)

2. (a) Discuss the consistency of the following system of equations

2x + 3y + 4z = 11, x + 5y + 7z = 15, 3x + 11y + 13z = 25 if consistent, solve them.

(b) A slider in a machine moves along a fixed straight rod. Its distance x cm. along the rod is given below for various values of the time t seconds. Find the velocity of the slider when t=0.1 second. (10+8)

| t | 0 | 0.1 | 0.2 | 0.3 | 0.4 | 0.5 | 0.6 |
|---|-------|-------|-------|-------|-------|-------|-------|
| x | 30.13 | 31.62 | 32.87 | 33.64 | 33.95 | 33.81 | 33.24 |

3. (a) Employ the method of least squares to fit a parabola $y = a + bx + cx^2$ in the following data :

| x | -1 | 0 | 0 | 1 |
|---|----|---|---|---|
| y | 2 | 0 | 1 | 2 |

- (b) If there are 3 misprints in a book of 1000 pages find the probability that a given page will contain (i) no misprint (ii) more than 2 misprints. (9+9)
- **4.** (a) Using Bisection Method, find a real root of the equation $x = \cos x$ correct up to two decimal figures.
 - (b) If 8 rooks (castles) are randomly placed on a chess-board, compute the probability that none of the rooks can capture any of the others. That is, compute the probability that no row or column contains more than one rook. (9+9)
- 5. (a) The mode of a certain frequency curve y = f(x) is very near x = 9 and the value of the frequency density f(x) for x = 8.9, 9.0 and 9.3 are respectively equal to 0.30, 0.35 and 0.25 calculate the approximate value of the mode.
 - (b) Evaluate $\int_0^{\frac{\pi}{2}} \sqrt{1 0.162 \sin^2 \phi} \, d\phi$ by Simpson's 1/3 rule correct up to two places of decimal, taking three points.
 - (c) If X and Y are two independent N(0, 1) random variable and $P=1+X+XY^2$ and Q=1+X, find Cov(P,Q). (6+6+6)

- 6. (a) A tray of electronics components contain nine good components and three defective components. If two components are selected at random, what is the expected number of defective components ?
 - (b) A number of arrivals of customers during any day follows Poisson distribution with a mean of 5. What is the probability that the total number of customers on two days selected at random is less than 2 ? (9+9)
- (a) If the number of telephones calls an operator receives between 10.00 pm to 10.10 pm following Poisson distribution with mean 3. The probability that the operator receives one call during the interval the next day is 0.149.
 - (b) The mean inside diameter of a sample of 200 washers produced by a machine is 0.502 cm and the standard deviation is 0.005 cm. The purpose for which these washers are intended allows a maximum tolerance in the diameter of 0.496 to 0.508 cm, otherwise the washers are considered defective. Determine the percentage of defective washers produced by a machine, assuming the diameters are normally distributed.
 - (c) Prove that arithmetic mean of the coefficient of regression is greater than the coefficient of correlation. (6+6+6)

Note: To obtain values of $e^{-\lambda}$ for other values of λ , use the laws of exponents.

Example: $e^{-3.48} = (e^{-3.00})(e^{-0.46}) = (0.04979)(0.6188) = 0.03081.$
